  <p>
Random Access Memory (RAM) </br>
It is also called read-write memory or the main
memory or the primary memory.
The programs and data that the CPU requires
during the execution of a program are stored in
this
memory.
It is a volatile memory as the data is lost
when the power is turned off.
RAM is further classified into two types- SRAM
(Static Random Access Memory) and DRAM (Dynamic
Random Access Memory).</br></br>
Read-Only Memory (ROM) </br>
Stores crucial information essential to operate
the system, like the program essential to boot
the
computer.
It is not volatile.
Always retains its data.
Used in embedded systems or where the
programming needs no change.
Used in calculators and peripheral devices.
ROM is further classified into four types-
MROM, PROM, EPROM, and EEPROM.
  </p>
```
